About Bivariate Correlations and Linear Regression: Examples

Types of Bivariate Correlations

- ▶ Given the following three graphs, select the correct description for each relationship

weak positive

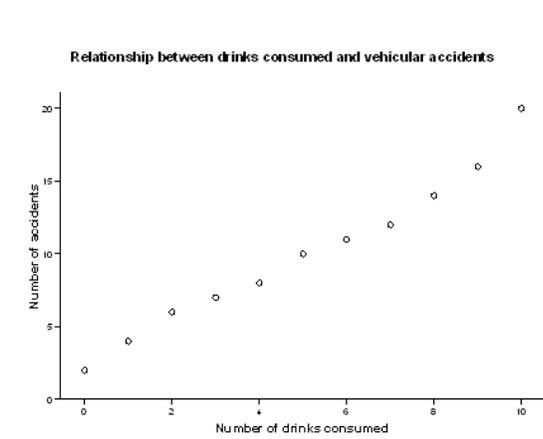

zero correlation

strong negative

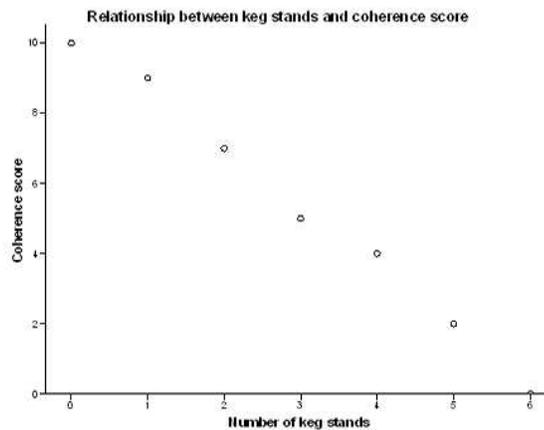

Positive Correlation

- ▶ A researcher examined the relationship between the number of alcoholic beverages consumed prior to driving and the number of vehicular accidents. A plotted graph indicated a strong positive relationship between the number of drinks consumed and the number of accidents.

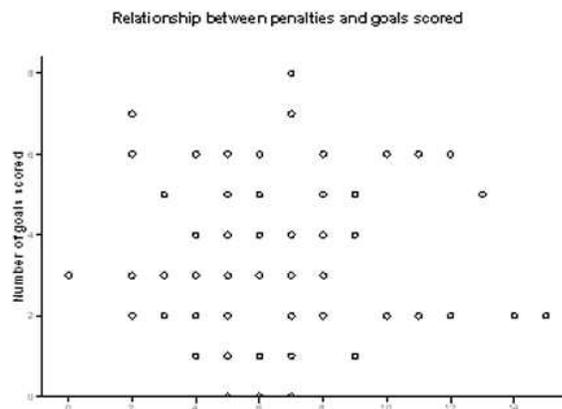

Negative Correlation

- ▶ A researcher attended a keg party and examined the relationship between coherence and the number of keg stands performed by an individual. Coherence was measured as a score from 0 to 10 (0 indicated no coherence and 10 indicated high coherence). A plotted graph indicated a negative relationship between coherence and the number of keg stands performed.

Zero Correlation

- ▶ A researcher examined the relationship between the number of goals that the Ottawa Senators scored and the number of penalties in each game of the 2006-2007 season. A plotted graph indicated a zero relationship between the number of penalties committed and the number of goals scored.

- ▶ The following graph represents a:
 - Strong negative correlation
 - Weak positive correlation
 - Strong positive correlation
 - Zero correlation

Determining the Value of r

- ▶ A researcher examined the relationship between the number of alcoholic beverages consumed prior to driving and the number of vehicular accidents. The data is provided below:

| X | X ² | Y | Y ² | XY |
|--------|----------------------|-----------|------------------------|---------|
| Drinks | Drinks ² | Accidents | Accidents ² | (D)(A) |
| 0 | 0 | 2 | 4 | 0 |
| 1 | 1 | 4 | 16 | 4 |
| 2 | 4 | 6 | 36 | 12 |
| 3 | 9 | 7 | 49 | 21 |
| 4 | 16 | 8 | 64 | 32 |
| 5 | 25 | 10 | 100 | 50 |
| 6 | 36 | 11 | 121 | 66 |
| 7 | 49 | 12 | 144 | 84 |
| 8 | 64 | 14 | 196 | 112 |
| 9 | 81 | 16 | 256 | 144 |
| 10 | 100 | 20 | 400 | 200 |
| ΣX=55 | ΣX ² =385 | ΣY=110 | ΣY ² =1386 | ΣXY=725 |

To determine the value of r, simply plug the data values into the formula

$$r = \frac{N(\sum XY) - (\sum X)(\sum Y)}{\{ [N(\sum X^2) - (\sum X)^2] [N(\sum Y^2) - (\sum Y)^2] \}^{1/2}}$$

$$r = \frac{11(725) - (55)(110)}{\{ [11(385^2) - (55)^2] [11(1386^2) - (110)^2] \}^{1/2}}$$

$$r = \frac{7975 - 6050}{\{ [4235 - 3025] [15246 - 12100] \}^{1/2}}$$

$$r = \frac{1925}{\{ [1210] [3146] \}^{1/2}}$$

$$r = \frac{1925}{\{3806660\}^{1/2}}$$

$$r = \frac{1925}{1951.07}$$

$$r = 0.99$$

Therefore the relationship between the number of drinks consumed and the number of vehicular accidents is $r = 0.99$.

This is a strong, positive correlation.

Determining the Value of R^2

- ▶ In the previous example, the correlation coefficient was $r = 0.99$. The coefficient of determination is:
 $R^2 = r^2 = .99 = .98$

Therefore, 98% of the variance in the number of accidents is accounted for by the number of drinks consumed, and 2% of the variance in the number of accidents is accounted for by some other factor.

Determining the Value of r and R^2

- ▶ A researcher conducted a study to examine the relationship between the number of alcohol beverages consumed and the number of parties attended by adults in a month.

The researcher obtained the following data:

$$\Sigma X(\text{alcohol beverages consumed}) = 120$$

$$\Sigma X^2 = 1240$$

$$\Sigma Y(\text{parties attended}) = 1536,$$

$$\Sigma Y^2 = 157050$$

$$\Sigma XY = 13312$$

$$N = 16$$

What is the value of r? 0.99

What is the value of R? 0.98

What kind of relationship is this? Strong positive relationship

Determining the Value of a and b

- Using the data from the drinking and driving example, determine the value of a and b:

| X | Y | $X-\bar{X}$ | $(X-\bar{X})^2$ | $Y-\bar{Y}$ | $(X-\bar{X})(Y-\bar{Y})$ |
|-------------|--------------|-------------|-----------------|-------------|--------------------------|
| 0 | 2 | -5 | 25 | -8 | 40 |
| 1 | 4 | -4 | 16 | -6 | 24 |
| 2 | 6 | -3 | 9 | -4 | 12 |
| 3 | 7 | -2 | 4 | -3 | 6 |
| 4 | 8 | -1 | 1 | -2 | 2 |
| 5 | 10 | 0 | 0 | 0 | 0 |
| 6 | 11 | 1 | 1 | 1 | 1 |
| 7 | 12 | 2 | 4 | 2 | 4 |
| 8 | 14 | 3 | 9 | 4 | 12 |
| 9 | 16 | 4 | 16 | 6 | 24 |
| 10 | 20 | 5 | 25 | 10 | 50 |
| $\bar{X}=5$ | $\bar{Y}=10$ | | $\Sigma=110$ | | $\Sigma=175$ |

To determine the value of b:

$$b = \frac{\Sigma(X - \bar{X})(Y - \bar{Y})}{\Sigma(X - \bar{X})^2}$$

$$b = \frac{175}{110}$$

$$b = 1.59$$

To determine the value of a :

$$a = \bar{Y} - b\bar{X}$$

$$a = 10 - 1.59(5)$$

$$a = 2.05$$

Therefore the regression equation for this example is:

$$Y' = 2.05 + 1.53X$$

- We want to determine how many accidents there would be if 5 drinks are consumed before driving:

$$Y' = 2.05 + 1.59X$$

$$Y' = 2.05 + 1.59(5)$$

$$Y' = 2.05 + 7.95$$

$$Y' = 10$$

Therefore, when 5 drinks are consumed before driving, there are approximately 10 accidents.
